

# TEST ENVIRONMENT SERVICES >>

The efficient set-up and management of test environments contributes significantly to a shorter time-to-market of your organization's new and changed services.

**It is an absolute necessity to test a new or changed service in the business processes of your organization before taking these into use. These tests are subject to increasingly higher demands. The test environments need to be a proper representation of the real situation in your company and their availability must be high. Atos Origin builds and manages test environments in conformance with these demands ensuring that your new or changed services will be introduced in an efficient manner.**

The quality of your service provisioning is a decisive factor in meeting the competition. This is especially true when a new or changed service is introduced. It is of vital importance to test these changes prior to their being implemented in your business processes. This to ensure that undesirable effects do not take place during daytoday operations.

Atos Origin has much experience in realizing and managing complex test environments which are representative of a company's end-to-end service provisioning.

## TIME TO REALIZATION

The test environments must be stable and reliable in order that all critical issues may be brought to the surface. This is generally a timeconsuming activity.

Atos Origin addresses the weak spots at an early stage in setting up a test environment to make sure that the test procedures will proceed as expected. As a result of this the new or changed service can be put into use according to your plans.

Test Environment Services offer you:

- An efficient realization of complex test environments
- The coordination and management of test environments
- The physical test environment, if so desired

## TEST ENVIRONMENT SERVICES >>

### TEST ENVIRONMENT

Atos Origin is able to supply a test environment including the required hardware and operational management services, whereby it is possible to have the hardware installed at an Atos Origin location, if so desired.

### APPROACH

A plan of approach is prepared which specifies the requirements the test environment has to meet, which parties are involved in setting up the test environment and how the test environment will be constructed. In building the test environment, attention will be paid to the test data fitting the chain of applications and systems. The required interfaces between the applications will also be realized and the overall configuration and version management of the test environment will be in place on time. Virtualization techniques may be applied to ensure efficient hardware deployment.

### TEST ENVIRONMENT MANAGEMENT

The “onestopshopping” principle is applied here, meaning that a single contact point is available for the coordination of incident and change processing. This clear responsibility allows the test employees to specifically concentrate on the actual testing, with more thorough testing as a result.

The service provisioning by Test Environment Services includes integral backup and recovery services as well.

Service level agreements can be drawn up for the full test environment, if you so desire. Atos Origin will translate these to specific agreements for the underlying components, for example, for each individual application and their interfaces.

### Are you interested?

We are pleased to investigate together with you and without obligation what advantages Test Environment Services may have for your specific situation.

#### Time to market

- Reliable test environment with ascertained service level agreements
- Clear management of setting up and managing test environments

#### Cost control

- Prior insight into costs and possible savings using virtualization techniques

#### Quality to market

- A higher availability allows you to perform extensive and exhaustive testing
